

ROCNA[®]

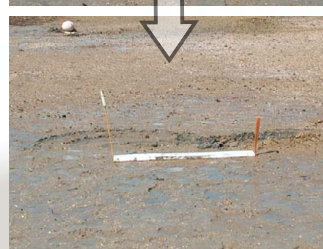

ANCHORS

demonstrations & independent testing

Complete setting reliability

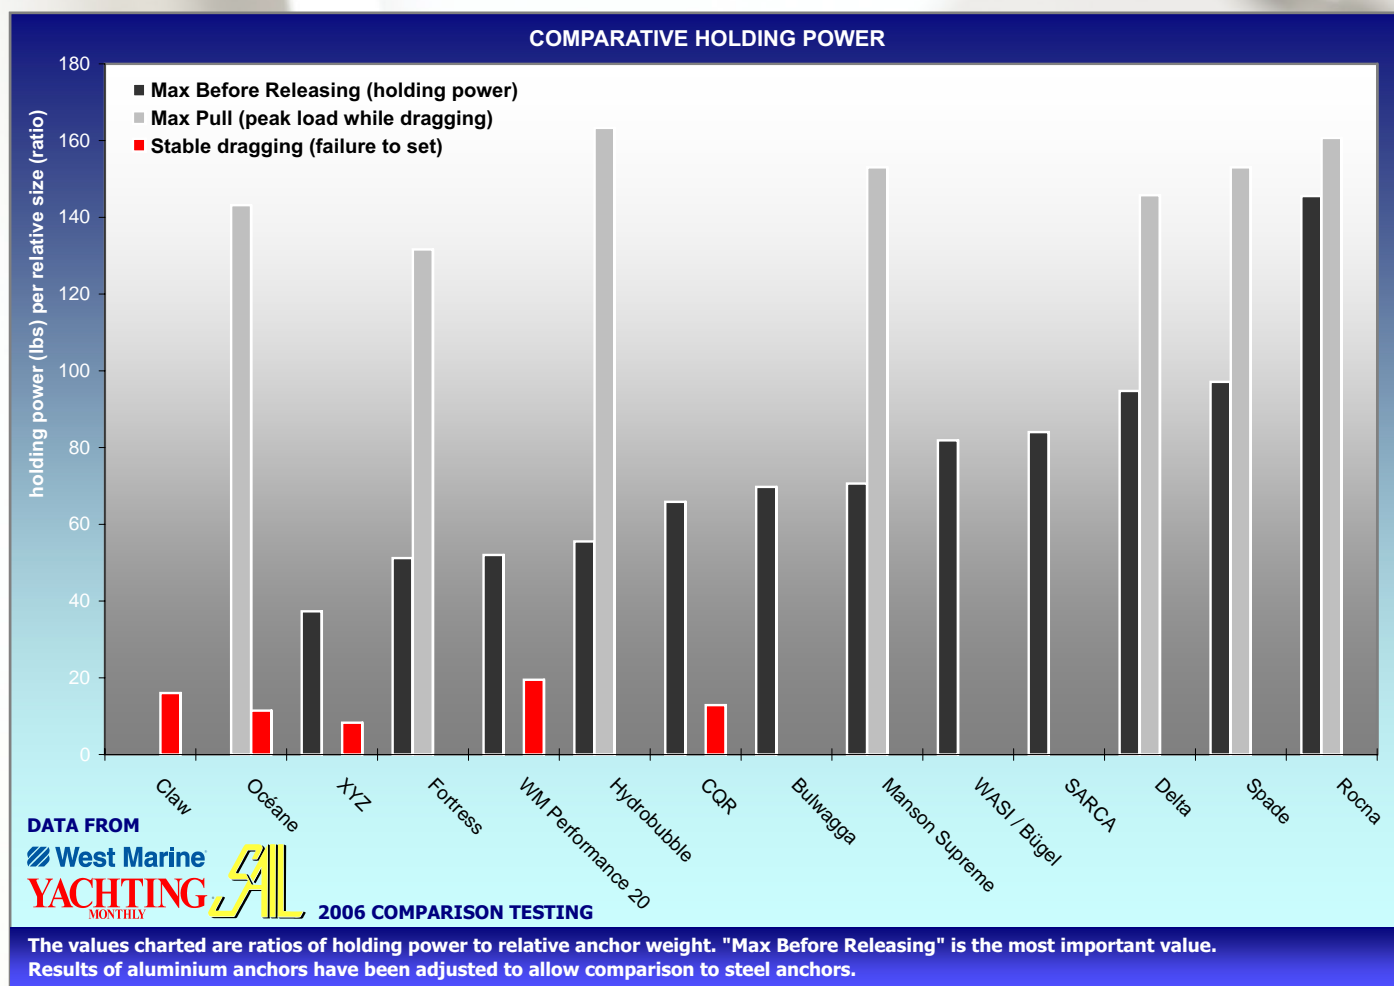

The Rocna can be relied upon to set in its own length, no matter where you drop it or how it lands. Note the minimal drag pattern in these photos.

"Always set quickly... the drag pattern always under a metre..." – Boating NZ

How much better is a Rocna?

To answer that question, below are some hard figures. These results are independent; they are from West Marine's 2006 anchor testing, which involved no less than fourteen types, three locations, and three different scopes (3:1, 5:1, and 7:1). The testing was written up in *SAIL* magazine.

Watch the video

Results from our own testing can be seen on our website, along with our video which demonstrates the setting performance of various anchors. We encourage you to watch this, as it will illustrate the relevance of the above independent test results.

"The Rocna was a powerful, impressive performer in our tests, recording instant sets at multiple 5,000lb maximum pulls at 5:1 scope..."
